

Data Flow Diagram

Date: 30 September 2026 | Team ID: 6ab2240ffc67a5bc0222524ef | Project: ComicCraft – AI Comic Story Creator

Level-1 Data Flow Description

Step	Source	Process	Output / destination
1	User	Enter story prompt, character, setting, tone and art style	Validated PromptRequest
2	PromptRequest	generate_outline()	Five structured panel records
3	Panel records	generate_story()	Five captions, narration and dialogue records
4	Image prompts	generate_image()	Five panel image files in static/panels
5	Outline + story + images	build_comic_layout()	Five-panel layout records
6	Layout + character name	save_pdf()	Comic PDF in static/exports
7	Browser	Preview / export response	User views or downloads comic

Data stores and external dependencies

Static assets store generated panel images and exported PDFs. The application configuration reads environment values for Gemini/Hugging Face credentials. The current image generation implementation uses Hugging Face InferenceClient with FLUX.1-schnell; the configuration also retains model settings for Gemini and image backends.

Simplified flow

User → HTML form → FastAPI route → Pydantic validation → outline → story → images → layout → PDF → preview/export
