

Code Layout, Readability and Reusability

Date: 30 September 2026 | Team ID: 6ab2240ffc67a5bc0222524ef | Project: ComicCraft – AI Comic Story Creator

Code layout checklist

S.No	Code quality parameter	ComicCraft implementation	Status
1	Consistent indentation	Python modules use consistent four-space indentation.	Followed
2	Proper file structure	Routes, schemas, services, utilities, templates, static assets and tests are separated.	Followed
3	Meaningful variable names	Names such as story_prompt, character_name, image_paths and pdf_path describe purpose.	Followed
4	Modularity	Generation, layout and export are separate service modules.	Followed
5	Reusable validation	PromptRequest centralizes request validation.	Followed
6	Error handling	Routes use HTTPException and try/except around generation.	Followed
7	Configuration separation	Settings are centralized in app/config.py and environment variables.	Followed
8	Testing	pytest tests cover homepage, docs, layout assembly and required files.	Followed

Readability and reusability

The project uses small functions with focused responsibilities. `build_comic_layout()` and `save_pdf()` are reusable independently of the browser route. The route orchestration keeps the sequence visible without embedding all generation logic inside a single function.

Repository hygiene

The package contains a `.gitignore` and `requirements.txt`. Secret values should remain outside the repository. Generated runtime assets under `static/panels` and `static/exports` should be treated as runtime output rather than credentials or source logic.
