

Performance Testing

Date: 30 September 2026 | Team ID: 6ab2240ffc67a5bc0222524ef | Project: ComicCraft – AI Comic Story Creator

Testing approach

Test area	Test / check	Expected result	Evidence in project
Homepage	GET /	HTTP 200 and ComicCraft appears in response.	tests/test_routes.py
API docs	GET /docs	HTTP 200.	tests/test_routes.py
Layout assembly	Build five outline/story/image records.	Result contains five panels in order.	tests/test_services.py
Required frontend files	Check index, preview and CSS.	Files exist.	tests/test_services.py
Input validation	Use empty/overlong request values.	Pydantic or route validation rejects invalid data.	schemas.py + routes.py
Panel count	Pass lists other than five panels to layout builder.	ValueError is raised.	layout_builder.py
PDF export	Pass valid layout with available images.	PDF is written to static/exports.	exporters.py
Image generation configuration	Run without HF_TOKEN.	Clear RuntimeError explains missing token.	image_generator.py

Performance considerations

The largest runtime cost is image generation because it may invoke a remote or local model and is repeated for five panels. Text generation in the packaged version is lightweight and deterministic. PDF assembly is comparatively small. For production use, background jobs, progress updates, caching, and asynchronous image processing would improve responsiveness.

Test evidence note

This package documents the test cases and the tests present in the source. It does not claim a live external-model performance benchmark because that requires the evaluator's environment, model availability and credentials.
