

Sample Project Documentation

Date: 30 September 2026 | Team ID: 6ab2240ffc67a5bc0222524ef | Project: ComicCraft – AI Comic Story Creator

Project description

ComicCraft is a web-based AI-assisted comic creator. It accepts a story prompt plus a character name, setting, tone and art style, then creates a five-panel comic structure. Each panel combines a title, scene description, image prompt, caption, narration and dialogue. Images are generated and saved as panel assets, the result is previewed in the browser, and the complete comic can be exported to PDF.

User scenarios

Scenario 1 – Story creation: A user enters “A student discovers a tiny robot in the college library,” chooses a character name, College setting, Adventure tone and Comic book art style. ComicCraft builds five panels and generates corresponding visual assets.

Scenario 2 – Style iteration: The user changes the tone to Funny and the art style to Anime, then submits again. The same workflow produces a new panel set based on the updated creative constraints.

Scenario 3 – Export: After reviewing the preview, the user downloads the generated PDF. The exporter creates one page per panel with the image and narrative content.

Implementation flow

Input → validation → outline → story → image generation × 5 → layout → preview → PDF export.

Limitations

The submitted generator modules use local/demo story generation rather than live Gemini calls, while image generation uses Hugging Face configuration and can require an HF token. There is no user account system or persistent database in the supplied implementation.
